

Cheap Technology Solutions brings fault-tolerance to the masses!

You don't have to be a big business with deep pockets to take advantage of the latest in fault-tolerant computing. CTS makes the safety and security of this technology available to you at a fraction of the cost of other solutions.

R.A.F.D. (Redundant Array of Floppy Disks)

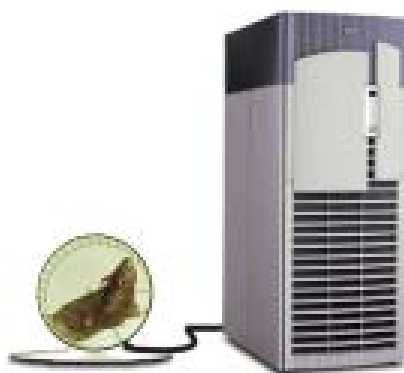

Yes, now you can sleep peacefully, knowing that your data is safe. Just insert six diskettes for a whopping 7.2mb of fault-tolerant storage. Also available in a smaller two-disk format for floppy mirroring. Access speeds up to 200ms! Wow!

P.P.C. (Palm Pilot Cluster)

They may be small, but did you know that PalmOS devices are really powerful enterprise computers? All that's missing is (you guessed it) fault tolerance! With the CTS PalmOS Cluster Controller, you can combine the computing power of up to eight handheld devices. Load-balancing applications among several PDAs ensures that your to-do list and calendar will always be there when you need them. A variety of cluster configurations are available, including active/active, active/passive, passive/passive and passive/aggressive.

U.N.I.P.S (Usually Not Interruptible Power Supply)

Maybe there will be a power outage, maybe there won't. Whatever happens, you can be mostly sure that your server will usually stay up and running. Just keep the unique HGPS (Hamster Generated Power Source) fueled with inexpensive PHC (Purina Hamster Chow) nuggets and in many cases enough power will be generated for you to perhaps shut down your server. Or not.

 **Cheap Technology Solutions** What you can afford is better than nothing.
